

**Assignment 1.**

Rongrong Su.  
20751822.

1.

(a) state: Represent the missionaries by M. and the cannibals by C. Let the boat be B. Each state can be represented by the item on each side  
eg. Side 1 {M.M.C.C?}, Side 2 {M.C.B?}. Side 1 {3M, 3C, b?}, side 2 {0}.

start state Side 1 {M.M.M.M., C.C.C.C.B?}, {3M, 3C, b?}

goal state: (1) Side 1 {B?}, Side 2 {M.M.M.C.C.C?}, {0M, 0C, 1}.

(2) Side 1 {0?}, Side 2 {M.M.M.C.C.C.B?}, {0M, 0C, b?}.

Successor function: A set of missionaries and/or cannibals <sup>(Move)</sup> can moved from side a to side b, if:

- the boat is set Move consists of 1 or 2 people that are on side a.
- the number of missionaries in the set formed by subtracting Move from Side a is 0 or it is greater than or equal to the number of cannibals
- the number of missionaries in the set formed by adding Move to Side b is 0 or it is greater than or equal to the number of cannibals

cost : each move has unit cost.

(b)

The search tree starts at the root node "for side a" with state "3m, 3c, b".  
Level 1 nodes: "1m, 2c", "3m, 1c", "2m, 2c".  
Level 2 nodes: From "1m, 2c" → "2m, 2c, b"; From "3m, 1c" → "3m, 2c, 1b", "2m, 1c, b"; From "2m, 2c" → "3m, 2c", "3m, 1c, b", "2m, 1c, b".  
Level 3 nodes: From "2m, 2c, b" → "2m, 2c", "1m, 1c"; From "3m, 2c, 1b" → "3m", "1m, 2c"; From "2m, 1c, b" → "3m, 1c, b", "2m, 1c, b".  
Level 4 nodes: From "2m, 2c" → "2m, 2c, b"; From "1m, 1c" → "2m, 1c, b"; From "3m" → "3m, 1c, b"; From "1m, 2c" → "2m, 1c, b"; From "3m, 1c, b" → "3m, 1c, b", "2m, 1c, b", "1m, 1c, b", "2m, 1c, b".  
Level 5 nodes: From "2m, 2c, b" → "3m, 1c, b", "2m, 2c, b", "1m, 3c, b", "2m, 1c, b", "1m, 2c, b"; From "2m, 1c, b" → "3m, 1c, b", "2m, 1c, b", "1m, 1c, b", "2m, 1c, b"; From "1m, 1c, b" → "3m, 1c, b", "2m, 1c, b", "1m, 1c, b", "2m, 1c, b"; From "3m, 1c, b" → "3m, 1c, b", "2m, 1c, b", "1m, 1c, b", "2m, 1c, b"; From "2m, 1c, b" → "3m, 1c, b", "2m, 1c, b", "1m, 1c, b", "2m, 1c, b".  
Level 6 nodes: From "3m, 1c, b" → "3m, 1c, b", "2m, 1c, b", "1m, 1c, b", "2m, 1c, b"; From "2m, 1c, b" → "3m, 1c, b", "2m, 1c, b", "1m, 1c, b", "2m, 1c, b"; From "1m, 1c, b" → "3m, 1c, b", "2m, 1c, b", "1m, 1c, b", "2m, 1c, b"; From "2m, 1c, b" → "3m, 1c, b", "2m, 1c, b", "1m, 1c, b", "2m, 1c, b".  
The tree shows many states that are repeats of the start state, indicated by arrows pointing back to the root or other nodes.

the path is

3m.3c.b → 3m.1c → 3m.2c.b → 3m → 3m.1c.b → 1m.1c → 2m.2c.b →

2c → 3c.b → 1c → 1m.1c.b → 0.00

Q2

Q2.

(1.) state : sequence of cities visited

start state : A

goal state : every city is visited once and the path at last goes back to A.  
with the lowest total cost.

successor function : travel from one city to another.

(b) heuristic function : distance to the nearest unvisited city from the current city + estimated distance to travel all the unvisited cities (MST heuristic) + nearest distance from an unvisited city to the start city.

(c) As shown below.

(d) As shown in picture, I fit the line with polynomial.

The function is  $y = 0.1318x^6 - 8.2705x^5 + 164.78x^4 + 505.9x^3 - 93574x^2 + 117076$

when  $x = 36$  the estimated number of estimated nodes is around 8800000

(e) As shown below.

(f) As shown in picture, I fit the line with polynomial it fits well when  $n = 1$  to 16

The function is  $y = 1131.4x^6 - 60510x^5 + 93546x^4 - 7E+06x^3 + 2E+07x^2 - 6E+07x + 2E+07$

when  $x = 36$  the estimated number will be <sup>greater</sup> than  $8E+11$  and close to  $10E+12$  which is a huge number.

(g) First MST heuristic is admissible. we can solve 36-cities problem in  $2.8 \times 10^7$  nodes. MST algorithm in fact, provides a smart way to find the smallest <sup>exploring</sup> path, using  $11AB + BC > AC$ . Actually,  $h(n)$  is always lower than the cost of moving from  $n$  to the goal. then  $A^*$  is guaranteed to find a shortest path. The lower  $h(n)$  is, the more nodes  $A^*$  expands, making it slower. (As we show in question (c) (e)) And it is very possible that with an improper  $h$  function (like  $h=0$ ) we can not get the solution of a problem.

## Number of nodes for TSP with h function

### Fitted line and estimated function

Estimates number when n=36

Number of nodes for TSP with h=0

Fitted line and estimated function

Estimates number when n=36

Q3

Q3

(i) Variables: 81 variables.  
 -  $A_{00}, A_{01}, \dots, A_{10}, A_{11}, \dots$   
 • Domains: nine positive digits  
 -  $A_i \in \{1, 2, 3, 4, 5, 6, 7, 8, 9\}$   
 - etc  
 • Constraints:  
 -  $A_{00} \neq A_{01} \neq A_{02} \neq A_{03} \neq \dots \neq A_{07}$  (the numbers of each row are different)  
 - etc  
 -  $A_{00} \neq A_{10} \neq A_{20} \neq \dots \neq A_{80}$  (the numbers of each column are different)  
 - etc  
 -  $A_{00} \neq A_{01} \neq A_{02} \neq A_{10} \neq A_{11} \neq A_{20} \neq A_{21} \neq A_{30} \neq A_{31} \neq A_{40} \neq A_{41} \neq A_{50} \neq A_{51} \neq A_{60} \neq A_{61} \neq A_{70} \neq A_{71} \neq A_{80} \neq A_{81}$   
 - etc  
 (every number of nine  $3 \times 3$  subregions of the  $9 \times 9$  board are different)

(ii) See code.

(f) 1. With more information, we can eliminate more number for the domain than the number of incorrect decisions and consequently the time spent backtracking by solving algorithm is greatly reduced.  
 [Four different algorithms]

2. As plots indicates the solver perform well when given 21-39 nodes. This is because puzzle with too many or too few initial values have either very loose or very tight constraints. In either case the solver is able to easily fill the remaining squares.

3. For first 2 versions the steps needed to take are the same. \* (Backward and forward)  
 Forward checking helps to eliminate values that would cause an error, but it doesn't help when trying to choose value is best.

**Number of assigned number of standard backtracking search.**

**Number of assigned number of standard backtracking search + forward check.**

**Number of assigned number of standard backtracking search + forward check + heuristic.**

standard backtracking search + forward check + heuristic
